In the early days of the Web, everything was text. Web pages were text files that had to be downloaded on your own computer, and you had to type in all of the information you wanted displayed. It's still the case today, except the Web has exploded into so much more than just text. The Web has evolved from the textual hypertext of the Web 1.0 to the fully multimedia, interactive Web of the Web 2.0. Now, a significant percentage of the Web is animation, video, and interactive graphics, which is the Web 3.0. What's the Future of the Web? Web 3.0, which has been evolving since the early 2000s, will continue to evolve. Just like Web 2.0, it's mostly a matter of how much the Web will change. The biggest change is that the Web will shift from being a Web server, where you only access static information, to a Web client, where the Web will be used to access any type of information. Right now, you're probably accessing web pages and looking at static text. By 2020, you will be able to watch movies and TV shows on the Web using Web clients, which has a ton of potential applications and will create a whole new industry. Web clients will also allow people to interact with the Web in new ways, like through virtual reality goggles, which we'll discuss more in the next section of the article. HTML5 HTML5 is the latest version of the HTML, which was introduced in 1998. It's the version of HTML that will be used for 5b5f913d15

AUSTRALIA is sitting on what is considered to be a goldmine of intellectual property. Awarded for creating the first polymer-based transistors used in televisions, academics say they now need to seek funding from the Australian government to help them develop new products. Feng Tang, associate professor of chemical engineering at the University of New South Wales, said the university had been using the IP, which protects the designs of life-changing inventions, for more than 15 years. "We developed it in collaboration with the universities of Switzerland, the UK and Canada, and what we've done is developed this new class of devices," Professor Tang said. "We have a polymer that can be used to make transistors which are smaller and are highly reproducible." Related Articles Professor Tang said he had been "shocked" by the speed at which the US Government blocked attempts to commercialise the patent. "We've invested in much more than TV sets and other devices, we've tried to commercialise it to make (medical) devices," he said. "We applied for a patent and we applied for Australian patent office priority for that. The patents were accepted by the Australian patent office but then the US Patent Office refused to register the patents and we've had to pay a
