How do you find $\mu_1(S)$, $\mu_2(S)$, and $\mu_3(S)$? In general if Σ is the cone over S then $\mu_i(\Sigma)=\mu_i(S)$. Also if S is a sphere then $\mu_i(\Sigma)=\mu_i(S)=4\pi$. A: I will assume that Σ means a sphere and S a non sphere. If you have a non spherical cone C_Σ over S then $\mu_2(C_\Sigma)=4\pi r$, where r is the radius of the sphere at infinity. What's new in this version: To remind you, that the file icon is set up again using the OS default.A lesbian couple with an 11-month-old baby girl were forced from the building they rented after they signed a lease without the landlord's consent. The couple identified only as "K." and "E." live in a Chicago apartment building where their upstairs neighbor is a man. When they moved into the building in February, they were met with many problems, including holes in the walls, broken windows, and cockroaches, records obtained by The Daily Caller show. "We would scream and we would bang on the door but no one would answer," K. told TheDC. "The smell was horrendous, so we had to just shut the door and try to stay alive." Most of the problems were quickly fixed by the property owner, who is reportedly a gay man who rents the penthouse to a gay male couple. The landlord and his tenants have a standing agreement to help one another in exchange for free rent. But the interloper's tenants decided to sue the landlord and his long-term tenants. The couple claimed they were not notified when their neighbor was moving in. They also claimed the landlord tricked them into signing a lease which they said included language that stated the tenant could not have children. In fact, there was no such language in the lease, K. told TheDC. "What we put in the lease is what we put in the lease," K. said. "We were trying to make a deal with the landlord." The tenants eventually found a neighbor to help them move into the apartment above them. They then filed a counterclaim against the landlords and insisted the landlord was behind the move, saying that they had discussed the possibility of moving into the building before signing the lease with the landlord. K. said she and her partner are trying to sell their home to buy a house in the suburbs. "I'm not willing to stay in this building anymore," she told TheDC. "I'm just not." Electronic non-impact printers have been developed to produce images on media by depositing ink on the media, typically paper. Several different types of electronic inkjet printers have been developed, including those of the drop-on-demand type and those of the continuous type, and typically, each type of printer has its advantages and disadvantages. The drop-on-demand type uses a large supply of ink in an ink reservoir, and ink droplets are ejected from the printer in response to

a drop signal. The continuous type, on the other hand, has relatively low ink volume and is generally more efficient in that it may print at a much higher rate than the drop-on-demand printers. Of course, those of ordinary skill in the art realize that drop-on-demand printers operate at relatively low speeds when compared to continuous printers. Moreover, drop-on-demand printers are generally much quieter than continuous printers. As a result, drop-on-demand printers are generally capable of printing at a higher quality image than continuous printers when used with similar media, and this is particularly true when the printer is used for printing large size graphics. However, despite their relatively high quality printing, drop-on-demand printers are relatively expensive to manufacture and require relatively larger ink supplies, which adds to their cost. For these reasons, those of skill in the art have been motivated to develop continuous printers. Such printers use relatively large ink supplies, but still have a relatively high printing speed. Moreover, such printers generally require a supply of toner or ink of a different color than the
