I've been searching the web but have come up with no answers.. Distributed objects are not supported in the current version of the. NET Framework and may be. What does Time Stopper 4.02l exactly does? I've been searching the web but have come up with no answers.. Distributed objects are not supported in the current version of the. NET Framework and may be. A: There is no menu option to stop auto run, and there is no restart your computer button on the top of the GUI. If you have to manually stop your simulation, then you'll have to press the Menu button (top left of the screen) then go to options and go to keymap. Then you can change the keymap. Edit: That is the stop button. 1. Field of the Invention The present invention relates to an automatic idle control apparatus, and more particularly to an automatic idle control apparatus for use with an engine system which automatically stops the engine when the engine is in an idle condition. 2. Description of the Prior Art There is a known system which automatically stops an engine when the engine is in an idle condition. This system is designed to stop the engine when the throttle valve of the engine is at its idle open position and the engine is in its idling condition. Japanese Patent Publication No. 60-47968 shows an automatic idle stop control system which employs a throttle valve control valve connected to a throttle valve operable with throttle valve associated with an engine to energize a solenoid. The throttle valve is deenergized by the throttle valve control valve whenever the engine is idling condition, or is energized whenever the engine is in a non-idling condition. Japanese Laid-Open Patent Application No. 62-113626 shows an automatic engine stop control system which is designed to deenergize an idle stop control means when the engine is not idling, or stop the engine when the engine is in a predetermined position on its predetermined travel. The predetermined position is either one of a position at which the f30f4ceada
