The compounds of the invention are potent blockers of voltage sensitive sodium (Na<sup>sup.+</sup>) channels in neuronal cells, and are therefore useful in the treatment of acute and chronic pain. In 1898, Karl Meyer and colleagues were the first to describe a specialized class of sodium channels having different properties from normal sodium channels. This class was given the name "depolarization-activated channels" and the members of this specialized class are today called "Meyer" channels. Meyer et al., Arch. Exp. Pathol. Pharmacol. 46:397-436 (1898). Although the Meyer channels have been described in various tissue types, one predominant location appears to be in the central nervous system where the channels are located in cell bodies and neuropil. The channels are permeable to sodium ions. Recently, two groups have isolated sodium channels from the central nervous system (CNS) and have cloned them. These cloned channels are named "P-type" (Sethmani et al., Nature 365:185-188, 1993; Wei et al., Neuron 14:767-775, 1995) and "Q-type" sodium channels (Catterall et al., Nature 366:270-271, 1993; Wang et al., Science 266:1683-1686, 1994; MacDermott et al., Nature 369:547-554, 1994). P-type and Q-type sodium channels are both involved in the development and maintenance of neuronal pathways in the CNS. P-type sodium channels are highly specific to sodium ions and are expressed primarily in regions of the CNS which are mainly involved in the conduction of the sensory nervous system, including the dorsal root ganglion, the trigeminal ganglion, and the spinal cord. P-type channels are located at the presynaptic 570a42141b
