Q: Addition of two large numbers in C in a type-safe manner Is there a more type-safe way of adding two large numbers (1000's of digits) in C? Currently, I am using strtod/srtod() to convert both numbers to floats first, then perform the addition and then convert the result back to a string. Is there a way to perform an addition in a type-safe manner? I want to be able to check if the result is a valid number. A: 'a += b' is unsafe and will lead to NaNs on most platforms due to overflow, as well as is not type-safe and will most likely give you a hard-to-debug error, particularly with types that sign-extend on overflow. Instead, use a union, which contains two different structures: one that contains the digits of the first argument, and one that contains the digits of the result. With this, you can easily perform addition operations on a structure without overflows:

```
struct bigstruct { struct bigstruct *left; int *result; };  
unsigned long sum = ((struct bigstruct)a).left + ((struct bigstruct)b).left;
```

This is safe and faster than the typical strtoul/strtod approach. Note that this is a singleton design; if you wanted to do larger numbers, you need to make two of these structs, one for each argument. On most platforms, it's also possible to achieve the same thing without the union, by using a simpler structure that isn't 'struct bigstruct'. However, there are reasons to prefer unions: 1) The compiler can generate better code to perform arithmetic on the union with the barest of knowledge of what the types are, and if you want to make changes to the types of the fields in the union, you must do so manually. 2) Non-conforming compilers may have trouble with the union design. 3) You need to make more adjustments to clean up the code, for instance, a union can break pointer arithmetic.
