What is Ipswitch Syslog Server The Symlog Server is a highly flexible, feature rich, and easy to use message logging and event management solution that is one of the most secure systems for syslog management available. The Symlog Server is especially suited for sophisticated enterprise/corporate syslog implementations. The latest version includes major enhancements to the original and proven Syslog Server from its de facto leader in this industry, WSO2. System Requirements Installation Requirements: The original Symlog Server requires two operating systems: 1) Microsoft Windows 2000, ME, NT, or XP and 2) Unix-based systems (Linux, Sun Solaris, *BSD, AIX, HP-UX) Note: The original Symlog Server is not supported on Windows 95 or Windows 98. Unlike prior versions, Ipswitch Syslog Server allows for single-server installations as well as node-based implementations and is highly scalable. Install Syslog Server on a single computer and restrict the IP address on your network to it, or use the Ipswitch Syslog Server node-based installation model to add or remove servers remotely. Syslog Server Web GUI: The Syslog Server is also available as a hosted service on the Web. Install the Web GUI and then access the server using a browser like Internet Explorer or Chrome. The Web GUI is accessed via the URL: Ipswitch Syslog Server 6.5.0 for Windows operates on a "GUI Server" mode to enable access from a browser as well as to support RPC style logfile administration using a "command line tool". The GUI Server mode is normally set as the default, but you can change the settings in the Ipswitch Syslog Server Web GUI. If you are looking to manage your Syslog Server via the Web GUI, then running the GUI Server mode is not required. The Web GUI comes with the MFA (multi-factor authentication) security features as well as the ability to add/remove servers to and from the GUI. To access the GUI Server, you must first install the Ipswitch Syslog Server from the Ipswitch Syslog Server Web GUI. The Web GUI is available at
