TIA graphics and drawings The TIA is a two-dimensional drawing format developed by the United States Air Force for the carriage of graphic and schematic drawings. The drawings contained in a TIA file do not include text and are essentially a collection of objects (parts, dimensions, lines, etc.) in a two-dimensional space. These drawings can be used by all Autodesk AutoCAD applications (with an exception of Legacy Windows Applications). The most common use is in the creation of electrical schematics. TIA is the first representation format developed by Autodesk for AutoCAD's DXF output. As such, it supports a number of AutoCAD features not found in the typical vector graphics format, such as the ability to represent parts and shapes as transparent polygons, specify dimensions using either explicit lengths or intrinsic properties, define a 2D point path, and combine these features into a drawing package that may be interpreted by other CAD software. From version 16 on TIA is the only output format that can be used for native DXF output, thus TIA is not compatible with "Legacy Windows Application".
