Medical Ethics IX-X (1959). New York: St. Martin's Press. 8. Synchronized, high-res to high-quality patient monitoring devices, such as electrocardiograph (ECG) equipment and the like, must be housed in a shielded enclosure to prevent the introduction of extraneous noise into the system. Shielded enclosures or cabinets are commonly used in these applications to house the patient monitoring device, which must be electrically isolated from the environment. This electrical isolation is important to prevent the introduction of extraneous noise into the patient monitoring device, which can interfere with readings or otherwise compromise the accuracy of the patient monitoring device. However, these shielded enclosures must allow the patient monitoring device to be easily accessed or handled. The ease of access to the device is especially important when treating individual patients. To accomplish this combination of features, metal enclosures are commonly used. The typical shielded enclosure for a patient monitoring device is a small metal box which includes a door that can be closed and locked. To allow for access to the interior of the enclosure
