A: You can use a simple bash script like this: `#!/bin/bash outFile="$1" tempFile=$(mktemp) while read line; do echo "$line" curl -O "" done` Q: Ordering data with a custom order I have an existing query which does a join between two tables and orders the results by comparing the price column. I would like to add a third column and sort by that also. It seems that the sql engine is using an index on the price column. I need to have a different order, maybe asc by name asc or something else. The examples that I have found online all use USING but I cannot use a custom order. A: Although not supported, you can do a bit of trickery by casting the result of a sub-query as text: `SELECT * FROM dbo.TASK WHERE Task_Type_ID = 1 AND Task_Item_ID = (SELECT Task_ID FROM dbo.ITEM WHERE Item_Type_ID = 1 ORDER BY CASE WHEN Sale_Price = 1 THEN 1 ELSE 2 END ASC, Item_Name ASC)` It's unlikely that you'll get good performance unless the execution plan contains a seek on the outer query.
