SCREENCAPTURE OF THE GAME. Article content continued That is, in part, what happened at least twice on the East Coast and once on the West Coast during summer 2007, according to data provided by the Association of American Railroads (AAR). The railroads also reported a drought warning in May 2009 that was not shared with the public. While electric trains lack the

extraordinary smokestacks that belch carbon into the atmosphere, they are still subject to air pollution rules. And when the rail industry declined, ambient air quality monitoring data revealed an increase in the harmful nitrogen oxides that power plant emissions emit, particularly during summer days. The worst episode came in July 2007, when sulphur dioxide pollution reached levels that are at the upper limit of the Environmental Protection Agency's class-action standards for public health. For

the past two weeks, API has been accumulating additional evidence that shows we are now in an intense, intensifying drought. We would expect the summer to be dry for the remainder of the year. We're also seeing a series of intense heat events that have broken record monthly temperatures for June. We've had more record heat than normal in the eastern United States for months. As the spring has lengthened into summer, we're seeing more and more of what this spring and summer looks like in drought.

conditions. As you see the availability of water decrease, and the potential for intense thunderstorms increase in the spring and early summer, we're going to see the intensity increase. API recognizes that June is almost always a month of record-breaking heat. But historically, June has usually been drier than normal, and the magnitude of the current June heat wave is unprecedented. If the current June heat wave event persists, it will most likely break nearly every record in the Eastern United States for any

summer month since reliable data began being collected in 1910. While it is currently above average, July is on track to be the first heat wave month in the United States since 1937. Much of the western United States is also experiencing these same record-breaking heat events that are making July the hottest month on record across most of the United States.
