History As CAD (Computer Aided Design) has been a common activity for many years, the following has become the accepted timeline of events in the evolution of CAD software and associated activities. In 1950's the software development arena consisted of mainframe systems and minicomputers. Mainframes had access to external information through the use of punched cards. Minicomputers were limited to performing algorithms stored in read only memory and control of hardware peripherals. Mainframes were used for most of the work in engineering, drafting, etc. In 1960's computer technology developed to the point that minicomputers were becoming more powerful than mainframes. Early CAD programs were designed to run on minicomputers, with access to data through punched cards or stored in magnetic tape. In 1970's mainframes were still used for most CAD programs, but minicomputers were increasing in use. In 1980's personal computers were starting to be used for CAD and drafting, with the majority of the work still being performed on mainframes. In the same decade, CAD programs began to be designed that could be run on personal computers without a graphics card or high-end minicomputer. Around 1980's, professional users of CAD started to develop CAD programs on personal computers, the majority of which ran on DOS. Common applications CAD is used for drawing plans, creating customised hardware, and working with models, etc. These types of uses and their associated examples are listed below. 1. Architectural Design Construction plans and design may be created for: Churches, schools, factories, etc. To create a plan, a 'draftsman' first starts with a 'project' including the following: Objects Floor plans Plan, elevation, section and perspective views Details of external walls Internal architectural features such as columns, beams, joists, etc. Roof Water and sewage systems, heating and cooling Electrical systems Fire exits Other facilities, such as gas and steam piping, elevators, etc. Churches have a great variety of internal features, so it is difficult to draw on a simple plan. The architectural plans of great temples, such as those at Angkor Wat, the Taj Mahal, and Palmyra, are still used today, more than two thousand years after the

Translation As of the release of AutoCAD 2008, Translation (from English to Chinese, Chinese to English, German to English, French to English, etc.) is available in AutoCAD LT. Variants AutoCAD LT (then called DWG Automation Tools) and AutoCAD R14 were the first AutoCAD products to feature a "separate document" architecture for drawing, drawing management, and drawing tracking. This architecture allows the user to open a drawing that has multiple layers. Each layer is referred to as a

document, and can be opened separately. When a new document is opened, its layers are put in a temporary store (called a memory cache), and can be modified and reopened as required. In addition, the user can save the drawing in a new file with a different name. With the release of AutoCAD 2007, all of the previously separate documents are now contained within one document. In AutoCAD 2008, separate documents are again made available, with drawing management and layers providing the main benefits. Other improvements include support for LiveLink, an application programming interface (API) for direct integration of drawing-related information (such as drawing management, version control, and annotation) with Internet Explorer. LiveLink is now used with AutoCAD 2009 and later. AutoCAD LT (then called DWG Automation Tools) and AutoCAD R14 and later use an icon-based drawing management system. Each drawing has a specific icon, and using this icon the user can locate the drawing by selecting it. Once a drawing is located, the user can open the drawing directly, even if it is no longer open on the active application. Also, the user can open drawings from a location without knowing their location. In AutoCAD, drawing management and layers are only available for multi-layers and support multiple drawing environments, such as 2D, 3D, networked, portable and batch processes. Features AutoCAD includes a variety of technical features and tools that vary from application to application. The main areas include: Coordinate and linear geometry Drafting, plotting and measurement tools Sheet metal and mechanical parts Numeric tools 2D/3D Utilities Architecture AutoCAD contains the following major components:

- Preprocessor - converts 2D or 3D drawings to PDF or DWG, a file format used by AutoCAD.
- Dispatcher - af5dca3d97

Local in vivo tritium uptake by sweat glands of the rat. Radiolabelled tritium in the form of T102 is detected in skin surface secretions from scintillation counting, which can be correlated to sweat gland activity. Our objective is to quantitate the cellular uptake of tritium by sweat glands and determine how closely the tritium labelling correlates to the activity of the sweat glands. The rat dorsum has been used as the model for the localization of sweat glands. Labelled T102 is absorbed from the surface of the skin and enters both the epidermis and the eccrine sweat glands. The uptake in epidermal and eccrine sweat glands is in the same order of magnitude. There is a correlation of activity to labelled tritium uptake, but not to labelling of the eccrine sweat glands. It is probable that the eccrine sweat glands have small openings that allow unhindered passage of labelled tritium to the skin surface. Combined use of N-acetylcysteine and thiamine ameliorates oxidative stress and oxidative cell damage in scopolamine-treated rats. Previous studies have shown that N-acetylcysteine (NAC) has an antioxidant effect and that thiamine (vitamin B1) has a cardioprotective effect. This study was designed to determine the effects of combined NAC and thiamine in scopolamine-induced oxidative stress and oxidative cell damage in rat hearts. Scopolamine was administered at a dose of 2 mg/kg/day, intragastrically, for 3 days. For the treatment, NAC and thiamine were given by the same route. After treatment, in vitro, cardiac levels of malondialdehyde and the activities of catalase, glutathione peroxidase, and superoxide dismutase were determined in heart homogenates. In the in vivo study, cardiac superoxide dismutase, glutathione peroxidase, and catalase activities, cardiac glutathione levels, and plasma levels of malondialdehyde were determined. NAC alone decreased malondialdehyde levels significantly and increased glutathione peroxidase activity. Thiamine alone increased the activity of catalase. Combination treatment with NAC and thiamine resulted in decreases in malondialdehyde levels and increases in the activities of all three antioxidant enzymes and glutathione levels
